Published by OpenStax College, U.S. History covers the breadth of the chronological history of the United States and also provides the necessary depth to ensure the course is manageable for instructors and students alike. U.S. History is designed to meet the scope and sequence requirements of most courses. The authors introduce key forces and major developments that together form the American experience, with particular attention paid to considering issues of race, class and gender. The text provides a balanced approach to U.S. history, considering the people, events and ideas that have shaped the United States from both the top down (politics, economics, diplomacy) and bottom up (eyewitness accounts, lived experience).

Health Industrialization discusses the way healthcare professionals distinguish between medicine, surgery, and diet and lifestyle guidelines. In other words, the ways that medicine aims to provide quantity of life. Men and women would rather remain in good health as long as possible and compensate for the deficiencies that crop up to the best of their abilities. Hence, they are looking for quality of life that results in tensions brought on by different objectives. This book hypothesizes that this tension is the cause of an industrialization of medicine or health that depends to a degree on the point-of-view we choose. Offers the key to understanding how this new form of industry will spread to create real change in the field of patient care Explores ethical issues and analyzes the various technologies at work in this transformation

World-renowned economist Klaus Schwab, Founder and Executive Chairman of the World Economic Forum, explains that we have an opportunity to shape the fourth industrial revolution, which will fundamentally alter how we live and work. Schwab argues that this revolution is different in scale, scope and complexity from any that have come before. Characterized by a range of new technologies that are fusing the physical, digital and biological worlds, the developments are affecting all disciplines, economies, industries and governments, and even challenging ideas about what it means to be human. Artificial intelligence is already all around us, from supercomputers, drones and virtual assistants to 3D printing, DNA sequencing, smart thermostats, wearable sensors and microchips smaller than a grain of sand. But this is just the beginning: nanomaterials 200 times stronger than steel and a million times thinner than a strand of hair and the first transplant of a 3D printed liver are already in development. Imagine "smart factories" in which global systems of manufacturing are coordinated virtually, or implantable mobile phones made of biosynthetic materials. The fourth industrial revolution, says Schwab, is more significant, and its ramifications more profound, than in any prior period of human history. He outlines the key technologies driving this revolution and discusses the major impacts expected on government, business, civil society and individuals. Schwab also offers bold ideas on how to harness these changes and shape a better future--one in which technology empowers people rather than replaces them; progress serves society rather than disrupts it; and in which innovators respect moral and ethical boundaries rather than cross them. We all have the opportunity to contribute to developing new frameworks that advance progress.

This volume analyzes the import patterns of selected countries to determine which nations are active importers and which ones import much less than expected. The majority of the work focuses on the industrialized countries, which are at the center of the international trading system, determining which are very active importers and which are not. Controls for wealth, size, and membership in customs areas are included. Countries importing at levels below predicted ones are the countries likely to be most effective at protecting domestic industries from foreign competition. For example, the results permit an evaluation of the arguments that Japan has consistently imported less than would be expected due to the presence of barriers protecting the domestic market.

Democracy is frequently considered a single (and thus uniform) national programme. However, political structures and opportunities differ clearly in various contexts, and as such they have their own influences and consequences. The study of democracy and democratisation must be reinforced with research that emphasises local perspective over national ones, for it is at the local level that different centres of power interact and understandings of genuine democratic practices are created. It is in this spirit that this book attempts to examine the diverse problem of democracy and democratisation in various Indonesian localities, while also underscoring the importance of considering asymmetrical approaches to democratisation. A mapping of the different local regimes in Indonesia and necessary to understand how they respond to or even bypass the practice of democracy. This book, drawing on eleven case studies, reaches the conclusion that the varied local regimes in Indonesia can be grouped into five categories: formalist/elitist, consociational, pluralist/compromistic, socio-cultural, and formalist/deliberative. Through its mapping of local regimes in Indonesia, this book offer a new passion for the continued and substantive (re)setting of democratisation in Indonesia, which need not be limited to electoral democracy, but may rely on asymmetrical democracy—a democracy that understands and accommodates localities and fundamental for it development. The future democratisation of Indonesia can be truly “ in the regions, from the regions, for Indonesia”. Using such a logic, democracy will be manifested through a bottom-up process, and therefore offer the ability to jointly manages Indonesia’s unity in diversity.

The drug discovery and development process is getting longer, more expensive, and no better. The industry suffers from the same clinical attrition and safety-related market withdrawal rates today as it did 20 years ago. *Industrialization of Drug Discovery: From Target Selection Through Lead Optimization* scrutinizes these problems in detail, contrasting the promise of technology and industrialization with the challenges of using the tools available to their best advantage. The book explores early successes, examines the current state of the art, and provides a strategic analysis of the issues currently facing drug discovery. Introducing the historical background and current status of the industry, the book delineates the basic tenets underlying modern drug discovery, how they have evolved, and their use in various approaches and strategies. It examines, in detail, the regulations, requirements, guidelines, and draft documents that guide so many FDA actions. The editor devotes the remainder of the discussion to industrialization, compound and knowledge management functions, the drug screening process, collaboration, and finally, ethical issues. Drawing on real-life, from-the-trenches examples, the book elucidates a new approach to drug discovery and development. This modern-day, back-to-basics approach includes three steps: understand the science, unravel the story, and then intelligently apply the technology, bringing to bear the entire armamentarium of industrialization techniques, not just automation, to the discovery process. Using these steps, you can meet the goals of more specific targets, more selective compounds, and decreased cycle times. In effect, you can look for a bigger needle in a smaller haystack. Daniel E. Levy, editor of the Drug Discovery Series, is the founder of DEL BioPharma, a consulting service for drug discovery programs. He also maintains a blog that explores organic chemistry.
