Nuclear fusion, process by which nuclear reactions between light elements form heavier elements (up to iron). In cases where the interacting nuclei belong to elements with low atomic numbers (e.g., hydrogen [atomic number 1] or its isotopes deuterium and tritium), substantial amounts of energy are released. The vast energy potential of nuclear fusion was first exploited in thermonuclear weapons, or hydrogen bombs, which were developed in the decade immediately following World War II.

~~Nuclear Fusion Power: Will it be the energy of the future?~~

Often regarded as the 'holy grail' of energy, nuclear fusion has been long thought of as a source of unlimited power! Nuclear power currently generates energy through the process known as nuclear fission. This is more commonly known as the process of splitting an atomic atom (or more accurately the splitting of the nucleus).

Nuclear power is always an option, but a controversial one. There are two different forms of nuclear power, fission and fusion. Fission is the splitting of heavy atoms and harnessing the energy that is released; this process has already been achieved. Today's nuclear plants run on fission, which produces highly toxic spent fuel as a byproduct.

~~The Problem With Nuclear Fusion — JSTOR Daily~~

Fusion power is a proposed form of power generation that would generate electricity by using heat from nuclear fusion reactions. In a fusion process, two lighter atomic nuclei combine to form a heavier nucleus, while releasing energy. Devices designed to harness this energy are known as fusion reactors .

~~Fusion power — Wikipedia~~

Nuclear fusion is a reaction in which two or more atomic nuclei are combined to form one or more different atomic nuclei and subatomic particles (neutrons or protons). The difference in mass between the reactants and products is manifested as either the release or the absorption of energy. This difference in mass arises due to the difference in atomic binding energy between the nuclei before and after the reaction.

~~Nuclear fusion — Wikipedia~~

Nuclear Fusion Power (Updated July 2020) Fusion power offers the prospect of an almost inexhaustible source of energy for future generations, but it also presents so far insurmountable engineering challenges. The fundamental challenge is to achieve a rate of heat emitted by a fusion plasma that exceeds the rate of energy injected into the plasma.

Cold fusion is a hypothesized type of nuclear reaction that would occur at, or near, room temperature. It would contrast starkly with the "hot" fusion that is known to take place naturally within stars and artificially in hydrogen bombs and prototype fusion reactors under immense pressure and at temperatures of millions of degrees, and be distinguished from muon-catalyzed fusion.

01:55. Nuclear fusion is considered by some to be the holy grail of an unlimited supply of clean energy. In the South of France an international collaboration of scientists is trying to achieve that by recreating the power of the sun, right here on earth. ITER, which is latin for "the way", will be the largest nuclear fusion experiment in the world, once construction is complete.
