Applied Partial Differential Equations: With Fourier ...

The Physical Origins of Partial Differential Equations. The initial condition is $u(x,0) = 0$ and the boundary condition is $u(0,t) = n_0$. To solve the equation go to characteristic coordinates $\xi = x - ct$ and $\tau = t$. Then the PDE for $N = N(\xi, \tau)$ is $N_\tau = -r \sqrt{N}$. Separate variables and integrate to get $2 \sqrt{N} = -r\tau + \Phi(\xi)$.

Partial differential equations also play a central role in modern mathematics, especially in geometry and analysis. The availability of powerful computers is gradually shifting the emphasis in partial differential equations away from the analytical computation of solutions and toward both their numerical analysis and the qualitative theory.

From $X''(1) = -X(1)$, we find that $-c^2 \mu^2 \sin \mu + c^2 \mu \cos \mu = -c^2 \mu \cos \mu - c^2 \sin \mu$. Hence μ is a solution of the equation $-\mu^2 \sin \mu + \mu \cos \mu = -\mu \cos \mu - \sin \mu \Rightarrow 2\mu \cos \mu = (\mu^2 - 1) \sin \mu$. Note that $\mu = \pm 1$ is not a solution and $\cos \mu = 0$ is not a possibility, since this would imply $\sin \mu = 0$ and the two equations have no common solutions.
