Obviously, TCP cannot be used in multicast applications, as it is clearly unicast-oriented. Figure 1. The second choice is Broadcast. The broadcast paradigm (see Figure 1.b) saves a lot of bandwidth compared to unicast. If you want to send something to all computers on your LAN, you don't need a separate copy for each. On the contrary, only

Several extensions to the programming API are needed in order to support multicast. All of them are handled via two system calls: `setsockopt()` (used to pass information to the kernel) and `getsockopt()` (to retrieve information regarding multicast behavior). This does not mean that 2 new system calls were added to support multicast. The pair
